

## Taxus Baccata

Yew trees contain the highly poisonous taxane alkaloids that have been developed as anti-cancer drugs.

In Western Europe the taxus baccata species contain a high level of the toxic components. This is called 10-deacetylbaccatine or 10DAB.

Because of the good climate in Western Europe it contains more of the active substance than the Chinese variety which has a lower concentration of 10DAB.

## Who are we?

Bio Taxon is a company specialized in handling, processing and making 10DAB powder for the pharma industry.

- Working together with different company's
- Buying fresh taxus clippings
- Extracting fresh and dried taxus to crude paste
- Processing crude paste
- Producing and testing 10DAB
- Active in pharma industry over the whole world.

## How we do it

The leaves of taxus baccata are collected in our own factory where we first clean the green fresh clippings for optimal quality.

After that we extract paste crude in the first proces to make 10DAB powder in the final step.

---

## Optimal quality

We can provide high quality 98% pure 10DAb powder.

A professional team within our facility is constantly testing the quality in our high-tech laboratory.

We have brought our production into compliance with the international quality, environment and occupational health and safety management standards.

---

## Service

- We provide a high level pre and after sale service making sure everything runs fluently.
  - Doing such we can build a comprehensive supply chain.
  - Follow-up team from beginning to end.
-
